

WARI AI NETWORK

Official Whitepaper

The world's first monetized neural network

English

Version 1.1 — 2026 Edition

2026

Warning. This document is the official Wari AI Network Whitepaper. It presents the vision, operation and long-term objectives of the project. WARI is a digital unit linked to participation in the ecosystem. Valuation targets are strategic objectives and are not financial guarantees.

1. Purpose and vision

Wari AI Network is a mobile application that provides a digital reward experience built around AI-assisted simulated mining, referrals and administered partnerships. Its purpose is to provide a simple, multilingual and auditable experience with a visible record of each movement of value.

The product prioritizes measurable progress and user protection through structured registration, profiles, invitation-only identity verification, official announcements and reviewed withdrawals.

2. User journey

- At first launch, the user selects a language from ten supported languages.
- Registration requires a country selected from a validated list; the country's phone dial code is added automatically. The four-character referral code is optional.
- A public nickname in the form Wari-XXXXXX is generated by the server so that email addresses and phone numbers are not exposed in referral lists.
- The profile displays balances, mined WARI, language, country, trust score and KYC status.

3. Current economic rules

- Registration: 5 WARI are credited once to a new user who signs up with a valid referral code. Without a code, no sign-up bonus is granted.
- Referral: the sponsor receives 10 WARI when a referred user completes registration using a valid code.
- Mining: a session lasts 7 hours. Depending on the activated level, it yields from 3.50 to 5.00 WARI; the absolute session cap is 5.00 WARI.
- Mining bonus: each complete tranche of 100 WARI earned through mining and claimed after rollout of the mechanism credits 10 USDT.
- Partners: the administrator defines the WARI reward for each offer; an account can be rewarded only once per offer.

4. Mining and boosts

Boost levels are a progression mechanism. Unlocking through a rewarded advertisement is confirmed by the server before activation. The selected level changes the expected session reward within the 5 WARI cap, preventing unbounded issuance.

Completed session claims are processed server-side and recorded in transaction history. The total mined amount is used only to calculate USDT threshold bonuses.

5. USDT, KYC and withdrawals

USDT credited through mining bonuses are maintained in a separate balance. A withdrawal requires a minimum amount of 10 USDT, approved KYC and a trust score of at least 50.

KYC document submission is available only following an administrative invitation. Documents are stored privately and made accessible to authorized administrators. When a withdrawal is submitted, funds are reserved until approval, rejection or final payment.

6. Architecture and security

- Flutter Android application with complete localization in ten languages and protected storage for authentication tokens.
- Django REST API authenticated with JWT tokens; financial writes are handled within atomic transactions.
- Firebase Cloud Messaging for notifications and announcements managed from administration.
- AdMob for rewarded advertisements linked to boosts, with server confirmation in production.
- Transaction history for mining, bonuses, referrals, partners, staking and withdrawals.
- In-app updates: the app checks for new versions published on the official website, downloads the APK and verifies its SHA-256 fingerprint before installation.

7. Staking, partners and operational limits

The application records a WARI staking position from 100 WARI, displayed for a two-year period at an annual rate of 20%. Position creation and display exist; automated maturity settlement must be completed and verified before operational use.

A partner offer may include an image or GIF, a link and a reward configured in administration. The current version proves the in-app join action; proof of a registration performed on an external service will require a partner API integration or webhook.

8. Roadmap and responsibility

- Complete production controls, HTTPS hosting and operational withdrawal management.
- Add external partner conversion verification where it is made available.
- Obtain legal review of terms, KYC compliance and economic communications before public distribution.
- Arrange native-speaker review of translations before definitive commercial publication.

9. Funding and investor support

Wari AI Network plans support from selected private investors who share the long-term vision of the project. This model aims for operational stability, strategic independence and controlled growth.

Investor partner details may be disclosed progressively according to project development and confidentiality obligations.

10. Roadmap 2026 — 2031

- 2026: official launch, first members, participation, referrals and rewards.

- 2027: target 100,000 active users and progressive USDT withdrawals for verified accounts.
- 2028: target one million users, smart contract preparation and first blockchain integrations.
- 2029: progressive listing, Wari AI wallet and community governance.
- 2030: Wari AI payment card, merchant partnerships and 5 million user target.
- 2031: mature ecosystem, 10 million user target and more decentralized governance.

11. WARI token distribution

The target total WARI supply is set at 1,000,000,000 units. Distribution places the community at the center while supporting development and ecosystem stability.

- 40%: community participation and daily rewards.
- 20%: staking and returns.
- 20%: strategic reserve and stabilization.
- 10%: development, marketing and partnerships.
- 10%: market liquidity and listing support.

12. Valuation objectives

The founding objective is to aim for 5 USD per WARI if the project reaches one million active users before the first half of 2028. This target depends on growth, adoption, regulation and market conditions.

No projection should be interpreted as a promise of return or price guarantee.

13. Questions and answers

- *Difference:* Wari AI Network combines mobile participation, neural networks and traceable rewards.
- *Generation:* WARI is credited when a participation session is activated and validated.
- *Phone:* participation should not consume heavy device resources.
- *Withdrawals:* available after approved KYC and a minimum balance of 10 USDT.
- *5 USD target:* ambitious, conditional on real adoption and not guaranteed.

14. Legal deposit and conclusion

The Official Whitepaper of Wari AI Network, Version 1.1, 2026 Edition, is intended to establish authorship of the concept, strengthen transparency and protect intellectual property rights attached to the protocol.

Wari AI Network does not promise instant wealth. The project gradually builds an ecosystem where every user strengthens the network and contributes to a shared ambition.

Join the network. Contribute to the movement. Let us build together.
